UNIT 6 Module 1 Relating Data

Relating Data

We live in the age of "big data," and we're surrounded by a seemingly endless supply of information that exists in many different places and formats. How can you effectively harness and share the disparate data your organization needs to succeed? Professor Haeger demonstrates a series of practical Excel-based data management tips in this introductory module, including how to convert and relate data from various sources and file formats and transform it into sophisticated, interactive dashboards that can improve analysis and guide the decision-making process. Use the companion Excel workbook tools as you view the module's video clips for a rich, hands-on learning experience. And share your thoughts on where, what, and how you use data with your classmates before you complete part one of your course project.
