# UNIT 4 Module 1 Complete a Loan Analysis

Complete a Loan Analysis

What is the best loan for your circumstances? How much will you end up paying in interest over the life of the loan? You can imagine different variables: Suppose you don't want the monthly payment to exceed a certain amount, or imagine that you want to have the loan paid off by a certain date. You might be considering refinancing a loan: Should you stay with the current terms you have or find a new way to finance? There are many variables you might want to consider.. In this module, you will use Excel to answer critical predictive analysis questions regarding loans. You will create an amortization schedule, which is a table that shows you every periodic payment on a loan. And you will access a workbook that allows you to follow along with Professor Haeger as she demonstrates using Excel to solve predictive problems.
